

Introduction Script

The general aim of this experiment is to learn about what gestures people will associate with different actions in a car if there was a sensor in the centre console of the back seat. We require your participation so that we can see what gestures passengers would use in different scenarios while being driven about.

The experiment will require each you to sit in the back seat of your car, if you have one, or a chair in your house. For a more realistic participation, we ask that, if you do have access to a car, that you use this.

You will be asked 10 questions. These questions will ask you how you would do something using a mid-air gesture i.e. not using any buttons or dials.

I will observe what gestures you do and if you have any questions, you can ask at any time during the survey.

It doesn't matter what gestures you use as the aim of the survey is to gather as many different gestures as possible from participants.

This survey will be done over Zoom and it will be recorded. If, at any time, you wish to withdraw from the experiment, just let me know.

Do you agree to taking part in this survey?

Do you have any questions before we start?
